

Julia Keedy*Denver Water*Presentation Abstract

Denver Water is Colorado's largest municipal water provider. Half of Denver Water's supply comes from the Colorado River basin. Therefore, understanding the risk and impacts of a Colorado River Compact Call is critical. Due to continuously changing conditions and the uncertainties in climate change, hydrology, demand, and Colorado River operations, we are not attempting to quantify the probability of a Compact Call. Instead, Denver Water is examining "what if" scenarios in order to add some context to the potential risks and impacts of a Compact Call. This presentation will give a general overview of this ongoing effort.
